

Yes.

Your existing Flutter app can absolutely handle Obsidian vault sync over Tailscale. This is actually the best option for your sovereign setup.

Recommended Approach: Native Flutter Sync Service

Why this is ideal:

- Keeps everything inside your controlled Flutter app (no extra tools).
- Runs in background on Android.
- Uses direct Tailscale IP → zero cloud.
- Can integrate with your existing sovereign logic (RKG flags, theme sync, etc.).

Core Implementation (add to your Flutter app):

Dart

```

// lib/services/obsidian_sync_service.dart
import 'dart:io';
import 'package:watcher/watcher.dart';
import 'package:workmanager/workmanager.dart';

class ObsidianSyncService {
  static const String tailscaleIP = "your-windows-tailscale-ip"; // e.g.
  100.x.x.x
  static const String vaultPathWindows = "/path/to/windows/obsidian-
  vault";
  static const String vaultPathPhone = "/storage/emulated/0/0bsidian/";

  static void initialize() {
    Workmanager().registerPeriodicTask(
      "obsidian_sync",
      "syncObsidianVault",
      frequency: Duration(minutes: 5),
    );
  }

  @pragma('vm:entry-point')
  static void syncObsidianVault() async {
    final watcher = DirectoryWatcher(vaultPathPhone);

    watcher.events.listen((event) {
      if (event.type == ChangeType.MODIFY || event.type == ChangeType.ADD)
      {
        final relativePath = event.path.replaceFirst(vaultPathPhone, "");
        final targetPath = "$tailscaleIP:$vaultPathWindows/$relativePath";

        // Simple rsync-like copy over Tailscale (or custom socket)
        Process.run('rsync', ['-avz', event.path, targetPath]);
      }
    });
  }
}

```

Setup steps:

1. Add dependencies: `watcher`, `workmanager`, `path_provider`.
2. Initialize in `main.dart`: `ObsidianSyncService.initialize();`

3. Ensure Tailscale is always connected on both devices.

Advantages over external tools:

- Unified with your sovereign Flutter app.
- Can trigger Ghost Protocol UI refreshes or RKG updates after sync.
- Full control over what gets synced (e.g., only RKG folder or specific notebooks).

This is cleaner and more sovereign than Syncthing or Resilio for your use case.

Would you like the full background service code with RKG integration and error handling?
