

Yes, Logseq has solid mobile integration.

Current State (April 2026)

- **Official Android App:** Yes, available on Google Play and F-Droid.
- **iOS App:** Also official and mature.
- **Core Features on Mobile:** Full graph view, daily journals, queries, PDF annotation, Markdown/org-mode editing, backlinks, and block-based workflow.

How It Fits Your Sovereign Setup

Logseq works excellently with local file sync over Tailscale:

Best Integration Path (Recommended):

1. Use your existing **Flutter rsync** or **Syncthing** to keep a shared vault folder in sync between Windows and phone (already set up).
2. On Android, open Logseq and point it to the synced folder (`/storage/emulated/0/Obsidian/` or your RKG folder).
3. Logseq will read/write the same Markdown files as your Obsidian/AppFlowy setup.

Advantages for you:

- Excellent mobile UX (better than AppFlowy on Android).
- Strong query system — can surface RKG triplets, sovereign notes, etc.
- Fully local + Tailscale compatible (no cloud needed).
- Can run alongside Obsidian if you want both.

Limitations:

- No native real-time collaboration (uses file sync like Obsidian).
- Graph performance can degrade with very large vaults (but fine for your RKG use).

Verdict:

Logseq is currently one of the best mobile options for your sovereign local workflow. It integrates cleanly with your existing Flutter sync pipeline and gives you a strong mobile front-end for your RKG and memory palace.

front-end for your RKG and memory palace.
