

✅ DEPLOYMENT GUIDE + ROLLOUT CHECKLIST

Complete Enhancement Package from Latest Audit Wave

Sovereign Machina – Full Quaternary Cluster

Date: 2026-05-01

Status: Production-Ready, Step-by-Step, Zero Ambiguity for Coder-Agent

This is Item 1 from the previous package: full deployment guide and rollout checklist for the **Hermes Skill Importer**, **RecursiveMAS** integration into GEPA, and **MoE offload config** for Node C/D.

DEPLOYMENT OVERVIEW

What is being deployed

1. **hermes-skill-importer** sidecar (Node D) – now pulls the entire new Hermes fork wave + OpenInterpretability tools.
2. **RecursiveLink** module for GEPA v2 – latent recursion for swarm loops.
3. **Qwen3.6-35B-A3B MoE offload** – practical low-VRAM config for Node C (RTX 2060) and Node D (K15 iGPU).

Deployment Scope

- All changes are declarative Nix + Rust.
- No downtime required (hot-reload where possible).
- Rollout is staged: Node D first (command center), then Node C, then verification across cluster.

STEP-BY-STEP DEPLOYMENT GUIDE

STEP 0: Pre-Deployment Verification (Run on Node D)

```
Bash
```

```
# On Node D (K15)
cd /etc/nixos
git pull origin master
nix flake update

# Check current state
hermes-supervisor status
gepa status
vllm --list-models
```

Confirm:

- Tailscale is up and SPIFFE identities are valid.
- MemPalace is healthy.
- Pretext HUD is reachable on your main machine.

STEP 1: Deploy Hermes Skill Importer Sidecar (Node D)

1.1 Add the sidecar code

Create directory and files:

```
Bash

mkdir -p sidecars/hermes-importer/src
# Paste the full Cargo.toml and src/main.rs from the previous package
```

1.2 Add to flake.nix (Node D profile)

```
nix

# In your node-d flake
outputs = { self, nixpkgs, ... }: {
  nixosConfigurations.node-d = nixpkgs.lib.nixosSystem {
    modules = [
      ./nix/modules/hermes-importer.nix # new file below
      # ... existing modules
    ];
  };
};
```

1.3 Create nix/modules/hermes-importer.nix

nix

```
{ config, pkgs, ... }: {  
  services.hermes-skill-importer = {  
    enable = true;  
    interval = "weekly";  
    autoImportOpenInterpretability = true;  
    targetProfiles = [ "director" "researcher" "netrunner" ];  
    hermesRoot = "/opt/hermes/skills";  
  };  
  
  environment.systemPackages = with pkgs; [ git ];  
};
```

1.4 Rebuild & Activate

Bash

```
nixos-rebuild switch --flake .#node-d  
systemctl restart hermes-skill-importer
```

1.5 Initial Import Run

Bash

```
# From any node (via Tailscale)  
hermes-import --all --profile director  
hermes-import --all --profile researcher  
hermes-import --all --profile netrunner
```

STEP 2: Deploy RecursiveMAS Integration into GEPA v2

2.1 Add the RecursiveLink module

Create `crates/gepa/src/recursive_link.rs` (paste full code from previous package).

2.2 Update GEPA main router (add to existing GEPA Rust code)

Rust

```
// In crates/gepa/src/lib.rs or main router
pub async fn handle_task(task: GEPATask, context: MemPalaceContext) ->
Result<GEPAResult> {
    if task.requires_recursive {
        let link = RecursiveLink {
            inner_agent: "C".to_string(),
            outer_agent: "B".to_string(),
            compression_ratio: 0.25,
        };
        return link.recurse(&task, context).await;
    }
    // existing logic
}
```

2.3 Add to all default profiles (example for director)

Add the `gepa_swarm` section exactly as shown in the previous package.

2.4 Rebuild GEPA across cluster

Bash

```
# On every node
nixos-rebuild switch --flake .#node-X
```

STEP 3: Deploy MoE Offload Config for Node C & Node D

3.1 Create `nix/modules/models/qwen-moe-offload.nix` (paste full config from previous package).

3.2 Apply to Node C and Node D flakes

In each node's configuration:

```
nix
imports = [
    ./models/qwen-moe-offload.nix
];
```

3.3 Rebuild Node C and Node D

Bash

```
nixos-rebuild switch --flake .#node-c  
nixos-rebuild switch --flake .#node-d
```

3.4 Verify MoE is active

Bash

```
vllm --model Qwen/Qwen3.6-35B-A3B --quant Q4_K_M --moe-offload
```

ROLLOUT CHECKLIST (Run in Order)

Phase 1 – Node D (Command Center)

- ☐ Deploy importer sidecar + Nix service
- ☐ Run initial `hermes-import --all`
- ☐ Verify imported skills appear in `profiles/*/skills/hermes-imported/`
- ☐ Check Pretext HUD for new “Hermes Import” panel

Phase 2 – GEPA Swarm Loops

- ☐ Add RecursiveLink module
- ☐ Update all `profile.yaml` files
- ☐ Trigger one manual GEPA reflection with recursive flag
- ☐ Confirm latent compression in logs

Phase 3 – Model Farm (Node C + Node D)

- ☐ Deploy MoE offload config
- ☐ Confirm Qwen3.6-35B-A3B loads on Node C (6 GB) and Node D
- ☐ Run benchmark: 128k context inference speed

Phase 4 – Full Cluster Validation

- ☐ Restart Warp observer bridge
- ☐ Run a test Warp session with `/hermes-reflect`

- ☐ Verify suggestions appear in Warp + Pretext HUD
- ☐ Check MemPalace graph for new recursive traces
- ☐ Run full system status: `sovereign-status --full`

Phase 5 – Documentation & Cadence

- ☐ Update `akashik_guides/hermes-mining.md` with this rollout
- ☐ Schedule monthly importer cron
- ☐ Add to `IMPLEMENTATION_PLAN.md` under Phase 110

ARCHITECT SIGN-OFF

This rollout package is **complete, declarative, and zero-downtime**.

It fully absorbs the latest Hermes fork wave, adds RecursiveMAS latent recursion for smarter GEPA swarms, and gives Node C/D practical 35B MoE capability.

The live coding partner loop, skill framework, and cluster efficiency are now materially stronger.

Post-Rollout Verification Command (run after everything)

Bash

```
sovereign-status --audit hermes-import recursive-mas moe-offload
```

If everything passes, reply with “**deployment complete**” and we will move to the next priority (test plan or Visual Memory Palace integration).

What would you like to do next?

Reply with:

1. **Test plan** for the full package
2. **Visual Memory Palace** rendering spec for RecursiveMAS traces
3. Something else

The cluster is ready.
