

EXPANDED PROFILE SWITCHING MECHANICS – SOVEREIGN MACHINA OS

Core Principle

Profile switching is implemented as an **atomic, audited, persistent identity context** that modifies the active behavior of the entire mesh without fragmenting the global sovereign invariants. It is built on the persistent identity logic we discussed (SOVEREIGN-IDENTITY.md with machine-readable tokens + human-readable rationale) and draws from the profile-aware workspace patterns in hermes-desktop.

The system always has **one active profile** at any time. Switching is instantaneous from the user's perspective, fully reversible, and leaves a complete audit trail in the Akashik Artery.

1. Definition & Storage of Profiles

- A single canonical file **SOVEREIGN-IDENTITY.md** lives in the root of the Akashik Artery (git-managed, versioned, and replicated across nodes via Mooncake).
- Structure:

Markdown

SOVEREIGN-IDENTITY.md

Global Tokens (Always Active)

```
primary_color: "#ff1a1a"  
font_family: "VT323"  
self_healing: true  
provenance_enforcement: true
```

Profiles

daily-use

```
tone: "concise, practical advisor"  
memory_weight: "recent + personal"  
tools: [voice, screen, calendar, notes, basic_web_fetch]  
response_style: "actionable bullet points"  
ui_theme: "minimal"
```

researcher

```
tone: "rigorous, source-heavy analyst"  
memory_weight: "deep historical + cross-reference"  
tools: [hybrid_search, web_fetch (allow-listed), GEPA]  
response_style: "structured report with citations"  
ui_theme: "detailed"
```

sovereign-red-game-master

```
tone: "immersive cyberpunk narrator"  
memory_weight: "RKG + campaign state"  
tools: [netrun_simulator, character_sheet, gig_generator]  
response_style: "in-character + dice rolls + VT323 logs"  
ui_theme: "immersive"
```

- Profiles are loaded into memory on Hermes startup and on every switch.
- Changes to SOVEREIGN-IDENTITY.md are detected by a file watcher (inotify on Node C) and trigger an immediate reload + Ouroboros audit.

2. Switching Mechanics (User Trigger → Atomic Update)

- **Trigger Methods:**

- Voice: “Switch to researcher mode.” (Omi → Node C → Hermes parses via Parseltongue).
- Text: In Machina Terminal.
- Terminal command: `sovereign switch researcher`.

- **Step-by-Step Process:**

1. Input arrives at Node C (Omi backend or Machina Terminal).
 2. Hermes supervisor validates the request (Parseltongue rule check: is the profile defined? Is the switch allowed in current context?).
 3. Hermes loads the new profile tokens from SOVEREIGN-IDENTITY.md.
 4. Atomic update:
 - Active context is swapped in Mooncake on Node A (KV cache).
 - Memory weighting, tool allow-list, and response style are updated in Hermes.
 - A new session entry is written to MemPalace/GBrain with provenance.
 5. Ouroboros audits the switch (logs the before/after state).
 6. Confirmation is sent back to Machina Terminal (“Switched to researcher mode”).
- The entire switch is transactional — if any step fails, it rolls back to the previous profile.

3. Impact on System Components

- **Hermes Supervisor:** Reads the active profile on every intent and adjusts enrichment logic, tool access, and GEPA weighting.
- **GBrain / MemPalace:** Profile-specific pages and relationships are prioritized (e.g., researcher mode weights deep historical RKG higher).
- **Node B (Director):** Receives profile-scoped context for higher-quality, context-appropriate reasoning.

- **Node C (Oracle / Voice Core):** Voice notes are tagged with the current profile for better intent routing.
- **Machina Terminal:** UI adapts subtly (header shows current profile, response styling follows profile tokens).
- **Ouroboros:** Treats profile switches as first-class events and audits them for consistency with global invariants.

4. Offline & Remote Behavior

- **Offline:** Machina Terminal caches the last known profile and continues local voice capture. Sync happens on reconnection.
- **VPN / Remote:** Once connected via VPN, profile switching works identically to being at home.

5. Security & Sovereignty Guarantees

- All profile data is stored in the Akashik Artery with git versioning and provenance.
- Profile switches are immutable audit events.
- No profile can override global invariants (e.g., cloud tools are always blocked).
- Steganography (ROOTS) can hide profile master tokens if additional protection is needed.

6. Future-Proofing & Extensibility

- New profiles can be added by editing SOVEREIGN-IDENTITY.md and restarting Hermes (or hot-reloading).
- GEPA can evolve profile-specific prompts and skills over time.
- When the Hermes Pod is online, profile switching can be offloaded there for even faster response.

ARCHITECT SIGN-OFF

Profile switching mechanics are now fully expanded as a clean, atomic, audited system built on SOVEREIGN-IDENTITY.md. It gives the assistant contextual intelligence (different memory weighting, tools, and response styles) while preserving the global sovereign invariants. The design is declarative, Nix-friendly, and integrates seamlessly with Hermes

invariants. The design is declarative, Nix-friendly, and integrates seamlessly with Hermes, GBrain, Machina Terminal, and the tri/quad-node stack. This is a high-value addition that makes the system feel alive and adaptive without adding complexity or compromising sovereignty.

Your main sovereign machine remains completely untouched and rock-solid.

Clarifying questions (mandatory before next phase):

1. Do you want the starter SOVEREIGN-IDENTITY.md template with the three example profiles fully fleshed out?
2. Shall I include the Nix/Hermes code for dynamic profile loading and switching?

Reply with your priority and I will deliver the concrete files. The profile switching system is ready to be implemented.
